

IN THE CLAIMS:

Please amend the claims as indicated below:

1. (Currently Amended) A method for compensating for polarization mode dispersion in an optical fiber communication system, comprising the steps of:

5 reducing said polarization mode dispersion using a cascade of two-port all-pass filters; and

adjusting coefficients of said two-port all-pass filters using a least mean square algorithm, wherein said adjusting step is performed by a device.

10 2. (Previously Presented) The method of claim 1, wherein said cascade of two-port all-pass filters comprises a two-channel structure consisting of multiple cascades of all-pass filters and directional couplers.

15 3. (Original) The method of claim 1, wherein said coefficient values are adjusted to minimize a cost function.

4. (Original) The method of claim 1, further comprising the step of measuring said polarization mode dispersion in a received optical signal.

20 5. (Original) The method of claim 4, wherein said measuring step employs a tunable narrowband optical filter to render information from energy detector measurements.

25 6. (Previously Presented) The method of claim 1, wherein said cascade of two-port all-pass filters comprises a first all-pass filter A having a vector a comprised of P coefficients and a second all-pass filter B having a vector b comprised of Q coefficients and wherein said least mean square algorithm adjusts said coefficients as follows:

$$w(n+1) = w(n) - \mu \nabla(J),$$

where n indicates the current iteration number and w is a composite coefficient vector defined as:

$$w = \begin{bmatrix} a \\ b \end{bmatrix}, \nabla(J) \equiv \begin{bmatrix} \frac{\partial J}{\partial a^T} & \frac{\partial J}{\partial b^T} \end{bmatrix}^T$$

is the $(P+Q) \times 1$ complex gradient of J with respect to w and T indicates a transpose operation, and

$$\frac{\partial J}{\partial a^T} = \begin{bmatrix} \frac{\partial J}{\partial a_1} & \frac{\partial J}{\partial a_2} & \dots & \frac{\partial J}{\partial a_p} \end{bmatrix}, \text{ and}$$

$$\frac{\partial J}{\partial b^T} = \begin{bmatrix} \frac{\partial J}{\partial b_1} & \frac{\partial J}{\partial b_2} & \dots & \frac{\partial J}{\partial b_Q} \end{bmatrix}.$$

5

7. (Currently Amended) A method for compensating for polarization mode dispersion in an optical fiber communication system, comprising the steps of:

reducing said polarization mode dispersion using a cascade of two-port all-pass filters; and

10 adjusting coefficients of said two-port all-pass filters using a Newton algorithm, wherein said adjusting step is performed by a device.

15 8. (Previously Presented) The method of claim 7, wherein said cascade of two-port all-pass filters comprises a two-channel structure consisting of multiple cascades of all-pass filters and directional couplers.

9. (Original) The method of claim 7, wherein said coefficient values are adjusted to minimize a cost function.

20 10. (Original) The method of claim 7, further comprising the step of measuring said polarization mode dispersion in a received optical signal.

11. (Original) The method of claim 10, wherein said measuring step employs a tunable narrowband optical filter to render information from energy detector measurements.

25

12. (Previously Presented) The method of claim 7, wherein said cascade of two-port all-pass filters comprises a first all-pass filter A having a vector a comprised of P coefficients and a second all-pass filter B having a vector b comprised of Q coefficients and wherein said Newton algorithm adjusts said coefficients as follows:

$$\mathbf{w}(n+1) = \mathbf{w}(n) - \mu \mathbf{H}^{-1} \nabla(J)$$

where n indicates the current iteration number and w is a composite coefficient vector defined as:

$$\mathbf{w} = \begin{bmatrix} \mathbf{a} \\ \mathbf{b} \end{bmatrix}, \nabla(J) \equiv \begin{bmatrix} \frac{\partial J}{\partial \mathbf{a}^T} & \frac{\partial J}{\partial \mathbf{b}^T} \end{bmatrix}^T$$

$\frac{\partial J}{\partial \mathbf{a}^T} \equiv \begin{bmatrix} \frac{\partial J}{\partial a_1} & \frac{\partial J}{\partial a_2} & \mathbf{K} & \frac{\partial J}{\partial a_p} \end{bmatrix}$, is the $(P+Q) \times 1$ complex gradient of J with respect to w, T

5 indicates a transpose operation and, a Hessian matrix, H, is defined as follows:

$$\mathbf{H} = \frac{\partial^2 J}{\partial \mathbf{w} \partial \mathbf{w}^T} = \begin{bmatrix} \frac{\partial^2 J}{\partial \mathbf{a} \partial \mathbf{a}^T} & \frac{\partial^2 J}{\partial \mathbf{a} \partial \mathbf{b}^T} \\ \frac{\partial^2 J}{\partial \mathbf{b} \partial \mathbf{a}^T} & \frac{\partial^2 J}{\partial \mathbf{b} \partial \mathbf{b}^T} \end{bmatrix} \text{ and}$$

$$\frac{\partial J}{\partial \mathbf{b}^T} \equiv \begin{bmatrix} \frac{\partial J}{\partial b_1} & \frac{\partial J}{\partial b_2} & \mathbf{K} & \frac{\partial J}{\partial b_Q} \end{bmatrix}.$$

13. (Currently Amended) A polarization mode dispersion compensator in an optical

10 fiber communication system, comprising:

a cascade of two-port all-pass filters having coefficients that are adjusted using a least mean square algorithm, wherein said adjustment is performed by a device.

14. (Previously Presented) The polarization mode dispersion compensator of claim

15 13, wherein said cascade of two-port all-pass filters comprises a two-channel structure consisting of multiple cascades of all-pass filters and directional couplers.

15. (Original) The polarization mode dispersion compensator of claim 13, wherein

said coefficient values are adjusted to minimize a cost function.

20

16. (Previously Presented) The polarization mode dispersion compensator of claim 13, further comprising a polarization mode dispersion measuring device for measuring said polarization mode dispersion in a received optical signal.

17. (Previously Presented) The polarization mode dispersion compensator of claim 16, wherein said polarization mode dispersion measuring device employs a tunable narrowband optical filter to render information from energy detector measurements.

5 18. (Currently Amended) A polarization mode dispersion compensator in an optical fiber communication system, comprising:

a cascade of two-port all-pass filters having coefficients that are adjusted using a Newton algorithm, wherein said adjusting step is performed by a device.

10 19. (Previously Presented) The polarization mode dispersion compensator of claim 18, wherein said cascade of two-port all-pass filters comprises a two-channel structure consisting of multiple cascades of all-pass filters and directional couplers.

15 20. (Original) The polarization mode dispersion compensator of claim 18, wherein said coefficient values are adjusted to minimize a cost function.

21. (Previously Presented) The polarization mode dispersion compensator of claim 18, further comprising a polarization mode dispersion measuring device for measuring said polarization mode dispersion in a received optical signal.

20

22. (Previously Presented) The polarization mode dispersion compensator of claim 21, wherein said polarization mode dispersion measuring device employs a tunable narrowband optical filter to render information from energy detector measurements.

25
